

What is a ton of air conditioning and what size system do I need for my home?

There are many things which will determine the size (capacity) system your home requires. Some of these are: square feet to be cooled, climate, humidity, number of windows, insulation factors, which direction your home faces, heat-producing appliances, and even the number of people who will be in the home. Arthur Air can do an energy analysis on your home and help you decide what your particular needs are for your lifestyle.
